### Paper Prototype

For my paper prototype, I began with a start page where it tells the purpose of the app and includes a start button. When the start button is hit, it leads to the list of clubs and tells the user to check on the clubs that they are interested in. There are also little arrows next to the names of the clubs and when those are clicked, it would show a little information on the club. On the bottom there is a submit button, that would lead to the calendars of each club, or an add an event button, where clubs can input events. On the calendar page, at the top, the user can select which club calendar they want to see and when a day is selected on the calendar, it shows more information on the events happening on those days. There is also a button that leads the user back to the list of clubs. On the add an event page, there is a form that the club fills out for the event and when it is submitted, there is a confirmation page that gives them an option to view the even on the calendar or go back to list of clubs. Some feedback that I got for this prototype was that there should be an option that allows the user to sort through the list of clubs such as alphabetically or by category.
